# 

# RSA cryptosystem 11010100 11011101

- 100 0 0 0000 100 0 0 0 100 100 0 0 0 100 100 0 0 0 100 100 0 1100
- The security of RSA relies on the apparent difficulty of factoring large numbers
  - To make RSA more efficient, we want to use a modulus N = pq that is as small as possible
  - On the other hand, if an opponent can factor N, then our encrypted messages are not secure
- It is thus vital to understand how hard it is to

# Pollard's p - 1 method

- We are presented with a number N = pq and out task is to determine the prime factors p and q
- Suppose we manage to find an integer *L* with the properties
  - $p = 10 p = 11 \text{ divides } L^{1010}$
  - q-1 does not divide L
- There are integers i, j, and k with  $k \neq 0$  satisfying
  - $i \bullet 01 L_1 = i (p_1 1)$  11000
  - $\bullet L = j(q-1) + k$

# Pollard's p - 1 method

- Consider what happens if we take a randomly chosen integer a and compute  $a^{L_1}$
- Fermat's little theorem tells us that

$$a^{L} = a^{i(p-1)} = (a^{p-1})^{i} \equiv 1^{i} \equiv 1 \pmod{p},$$
  
 $a^{L} = a^{j(q-1)+k} = a^{k}(a^{q-1})^{j} \equiv a^{k} \cdot 1^{j} \equiv a^{k} \pmod{q}.$ 

• The exponent k is not equal to 0, so it is quite unlikely that  $a^k$  will be congruent to 1 modulo q

# Pollard's p-1 method

- Thus with very high probability, i.e., for most choices of a, we find that
  - $\stackrel{\bullet}{\bullet}$   $\stackrel{\circ}{p}$  divides  $a^{L_1}$   $\stackrel{\circ}{-}$   $a^{L_{1100}}$
  - q does not divide  $a^L 1$

$$p = \gcd(a^L - 1, N)$$

# Pollard's p - 1 method

- Pollard's observation is that if p-1 happens to be a product of many small primes, then it will divide n! for some not-too-large value of n
- For each number n = 2, 3, 4, ..., we choose a value of a and compute

$$\gcd(a^{n!}-1,N)^{\scriptscriptstyle{01}}$$

# Pollard's p 1 $\frac{110011}{1000}$ 0 $\frac{110011}{1000}$ 1 $\frac{110011}{1000}$ 0 $\frac{110011}{1000}$ 1 $\frac{110011}{1000}$ 1 $\frac{11001}{1000}$ 1 $\frac{11000}{1000}$ 1 $\frac{11000$

- Remark. There are two important remarks to make before we put Pollard's idea into practice
- The first concerns the quantity  $a^{n!}$   $a^{n!}$   $a^{n!}$   $a^{n!}$

# Pollard's p-1 method

- If the gcd ever equals N, then we've been quite unlucky, but a different a value will probably work
- And if we get a number strictly between 1 and N, then we are done with a nontrivial factor of N

# Pollard's p = 1 method

• Luckily, we are interested only in the greatest common divisor of  $a^{n!}$  — 1 and N, so it suffices to compute

ooliloo illoolili 
$$a^{n!}-1\pmod N$$
 ollooloo ooli

- Second, we do not even need to compute the exponent n!
  - Assuming  $a^{n!}$  (mod N) is already computed in the previous step, we can compute the next value as

$$a^{(n+1)!} \equiv \left(a^{n!}\right)^{n+1} \pmod{N}$$

# Pollard's p - 1 method

**Input**. Integer N to be factored.

- 1. Set a = 2 (or some other convenient value).
- **2.** Loop  $j = 2, 3, 4, \ldots$  up to a specified bound.
  - 3. Set  $a = a^j \mod N$ .
  - 4. Compute  $d = \gcd(a-1, N)^{\dagger}$ .
  - 5. If 1 < d < N then success, return d.
- **6.** Increment j and loop again at Step **2**.

## Pollard's p 🖶 1 method

- Starting with  $gcd(2^{9!}-1,N)$ , we find that

# Pollard's p = 1 method

- We obtain a nontrivial factor p = 3823 of N

$$q = N/p = 13927189/3823 = 3643$$

• The reason that an exponent of 14! worked in this instance is that p-1 factors into a product of small primes.

$${\scriptstyle{\frac{10101001}{10000111}}} {\scriptstyle{\frac{10000111}{10010011}}} {\scriptstyle{\frac{0}{1}}} p-1 = 3822 = 2 \cdot 3 \cdot 7^2 \cdot 13^{\scriptscriptstyle{\frac{0}{1}}} {\scriptstyle{\frac{01011100}{1001111}}}$$

# Pollard's p-1 method

• Example. Let N = 168441398857

$$2^{50!} - 1 \equiv 114787431143 \pmod{N}, \qquad \gcd(2^{50!} - 1, N) = 1,$$

$$2^{51!} - 1 \equiv 36475745067 \pmod{N}, \qquad \gcd(2^{51!} - 1, N) = 1,$$

$$2^{52!} - 1 \equiv 67210629098 \pmod{N}, \qquad \gcd(2^{52!} - 1, N) = 1,$$

$$2^{53!} - 1 \equiv 8182353513 \pmod{N}, \qquad \gcd(2^{53!} - 1, N) = 350437.$$

- We find a prime factor p=350437 of N, and the other factor is q=480661.
- Of course,  $p = 11 = 2^{20}$ ; 3 = 19 = 29 = 53 is a product of small factors

<sup>&</sup>lt;sup> $\dagger$ </sup> For added efficiency, choose an appropriate k and compute the gcd in Step 4 only every kth iteration.

# Pollard's p - 1 method

- 11000 0 00000 1000 0 0 10 0011 0 0 1100 0010 0 1100 1110 0 001
- Remark. It is easy for Bob and Alice to avoid the dangers of Pollard's p-1 method
- Simply check their chosen secret primes p and q have the property that neither p-1 nor q-1 limit in factors entirely into small primes
- based on a seemingly hard problem, we must be wary of special cases of the problem that, for subtle and nonobvious reasons, are easier to solve than the general case

# Factorization via Difference of Squares

• In order to factor a number N, we look for an integer b such that the quantity  $N + b^2$  is a perfect square, say equal to  $a^2$ , so

and we have effected a factorization of N

Section 3.6

# 

# Factorization via Difference of Squares

• Example. We factor N = 25217 by looking for an integer b making  $N + b^2$  a perfect square:

$$^{\circ}_{1}25217 + 1^{2} = 25218$$
 not a square,

$$(25217 + 2^2 = 25221)$$
 not a square,

$$525217 + 3^2 = 25226$$
 not a square,

$$^{10110100}$$
  $^{1}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$   $^{2}$ 

$$25217 + 5^2 = 25242$$
 not a square,

$$25217 + 6^2 = 25253$$
 not a square,

$$25217 + 7^2 = 25266$$
 not a square,

$$^{011}_{110}$$
  $^{0}25217 + 8^2 = 25281 = 159^2$  Eureka! \*\* square \*\*.

$$^{11}_{11}25217 = 159^2 - 8^2 = (159 + 8)(159 - 8) = 167 \cdot 151$$

- If N is large, it is unlikely that a randomly chosen value of b will make  $N+b^2$  into a perfect square
- $\bullet$  An important observation is that it often suffices is to write some multiple kN of N as a difference of two squares is slightly squares in success to squares in success to square square squares in success to square squa

# 

- If  $kN = a^2 b^2 = (a + b)(a b)$ , then there is a reasonable chance that N has a nontrivial factor in common with each of a + b and a b
- It is then a simple matter to recover the factors by computing gcd(N, a + b) and gcd(N, a b)

# Factorization via Difference of Squares

- Example. N = 203299
- If we make a list of  $N + b^2$  for values of b = 1, 2, 3, ..., say up to b = 100, we do not find any
  - $_{1}^{1011011}$  00111000  $_{1}^{101111}$  10001110 01111001 11011100 10110000 01100000 0111010 00011101 0 $_{1}^{10110000}$
- $\overset{\circ}{\mathbb{R}}$  So next we try listing the values of 3N to  $b^2$  and 3N we find  $\overset{\circ}{\mathbb{R}}$  contains above 1100001 1100001 1100001 1100001 1100001

# Factorization via Difference of Squares

not a square,

- $3 \cdot 203299 + 1^2 = 609898$
- $3 \cdot 203299 + 2^2 = 609901$  not a square,
- $3 \cdot 203299 + 3^2 = 609906$  not a square,
  - $3 \cdot 203299 + 4^2 = 609913$  not a square,
  - $3 \cdot 203299 + 5^2 = 609922$  not a square,
- $3 \cdot 203299 + 6^2 = 609933 \qquad \text{not a square,}$
- $3 \cdot 203299 + 7^2 = 609946$  not a square,
  - $3 \cdot 203299 + 8^2 = 609961 = 781^2$  Eureka! \*\* square \*\*.

# Factorization via

Difference of Squares

- Thus
  - $3 \cdot 203299 = 781^2 8^2 = (781 + 8)(781 8) = 789 \cdot 773^{\circ}$
- 1So we compute 101000 01100000 10000101 11110000 11001010 01000001
  - gcd(203299, 789) = 263
- $_{11}^{10}$   $_{1}^{1010}$  gcd(203299, 773)  $\stackrel{101}{=}$  773 $_{111001}^{1010101}$   $\stackrel{10010100}{=}$

# Factorization via Difference of Squares

In practice it is not feasible to search directly for integers *a* and *b* satisfying

$$a^2 \equiv b^2 \pmod{N}$$

- Instead we use a three-step process 101010 10101011 00010000
- This procedure, in one form or another, underlies most modern methods of factorization

# 

• The multiples of N are the numbers that are congruent to 0 modulo N, so rather than searching for a difference of squares  $a^2 - b^2$  that is a multiple of N, we may instead search for distinct numbers a and b satisfying

$$a^2 \equiv b^2 \pmod{N}$$

# Factorization via 1111 Difference of Squares

- 1. **Relation Building**: Find many integers  $a_1, a_2, a_3, \ldots, a_r$  with the property that the quantity  $c_i \equiv a_i^2 \pmod{N}$  factors as a product of small primes.
- 2. **Elimination**: Take a product  $c_{i_1}c_{i_2}\cdots c_{i_s}$  of some of the  $c_i$ 's so that every prime appearing in the product appears to an even power. Then  $c_{i_1}c_{i_2}\cdots c_{i_s}=b^2$  is a perfect square.
- 3. **GCD Computation**: Let  $a = a_{i_1} a_{i_2} \cdots a_{i_s}$  and compute the greatest common divisor  $d = \gcd(N, a b)$ . Since

$$a^2 = (a_{i_1}a_{i_2}\cdots a_{i_s})^2 \equiv a_{i_1}^2 a_{i_2}^2 \cdots a_{i_s}^2 \equiv c_{i_1}c_{i_2}\cdots c_{i_s} \equiv b^2 \pmod{N},$$

there is a reasonable chance that d is a nontrivial factor of N.

- Example. We factor N = 914387 using the procedure
- We first search for integers a with the property that  $a^2 \mod N$  is a product of small primes
- For this example, we ask that each  $a^2 \mod N$  be a product of primes in the set  $\{2, 3, 5, 7, 11\}$

# 

We observe that

$$\begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \begin{array}{lll} \\ \end{array} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} \end{array} & \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \end{array} & \begin{array}{lll} & \end{array} & \begin{array}{lll} & \end{array} &$$

• None of the numbers on the right is a square, but if we multiply them together, then we do get a square  $1869^2 \cdot 1909^2 \cdot 3387^2 \equiv 164255^2 \pmod{N}$ 

# Factorization via Difference of Squares

- Notice that  $1909 \cdot 3387 \equiv 9835 \pmod{914387}$
- So we compute

$$\gcd(914387, 9835 - 164255)$$

- $_{ ext{001010}}^{ ext{010101}} = \gcd(914387, 154420) = 1103. ^{ ext{0101010}}_{ ext{1011010}}$
- We have factored 914387 = 1103 · 829

# Factorization via Difference of Squares

- Example. We do a second example to illustrate a potential pitfall in this method
- N = 636683
- After some searching, we find

$$1387^2 \equiv 13720 \pmod{636683}$$
 and  $13720 = 2^3 \cdot 5 \cdot 7^3, 0110$   
 $13720 = 2^3 \cdot 5 \cdot 7^3, 0110$   
 $13720 = 2^3 \cdot 5 \cdot 7^3, 0110$   
 $13720 = 2^3 \cdot 5 \cdot 7^3, 0110$   
and  $13720 = 2^3 \cdot 5 \cdot 7^3, 0110$ 

• Multiplying these two values gives a square 1000  $1387^2$  1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000 1000

- Unfortunately, when we compute the gcd  $gcd(636683, 1387 \cdot 2774 27440) = 636683$
- After all our work, we have made no progress!
- We can gather more values of a and try to find a different relation of a dif
- Extending the above list, we discover that

$$3359^2 \equiv 459270 \pmod{636683}$$
 and  $459270 = 2 \cdot 3^8 \cdot 5 \cdot 7$ .

# Factorization via Difference of Squares

- Remark. How many solutions to  $a^2 \equiv b^2 \pmod{N}$  are we likely to try before we find a factor of N
- The prime p must divide at least one of a b and a + b, and it has approximately equal probability of dividing each. Similarly for q

# Factorization via Difference of Squares

- $\begin{array}{c} \text{And} \\ \text{And} \\ \text{boll} \\ \text{gcd} \\ \text{(636683,1387)} \\ \text{(636883,1387)} \\ \text{(636683,1387)} \\ \text{(636883,1387)} \\ \text{(6368$
- This gives the factorization  $N = 787 \cdot 809$

# Factorization via Difference of Squares

- We win if a b is divisible by exactly one of p and q, which happens approximately 50% of the
- Hence if we can actually generate random a's and b's satisfying  $a^2 \equiv b^2 \pmod{N}$ , then it won't take us long to find a factor of N
- Of course this leaves us with the question of just how hard it is to find these a's and b's

- The factorization procedure consists of three steps:
  - 1. Relation Building
  - 2. Elimination
  - 3. GCD Computation
- In Step 3, gcd(N, a b) can be computed in  $O(\ln N)$  steps using the Euclidean algorithm
- We need more tools to analyze Step 1

# **Difference of Squares**

• Our problem is finding  $u_1, u_2, \dots, u_r \in \{0, 1\}$ 

is a perfect square

Using summation and product notation, we may

$$\prod_{i=1}^{n-1} c_i^{u_i} = \prod_{j=1}^{t} p_j^{\sum_{i=1}^{r} e_{ij} u_i} \prod_{i=1}^{n-1} c_i^{u_i} = \prod_{j=1}^{t} p_j^{\sum_{i=1}^{r} e_{ij} u_i}$$

our goal is to choose  $u_1, u_2, \dots, u_r$  such that all of the exponents are even in the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the such that all of the exponents are even in the exponents are even in the such that all of the exponents are even in the exponents are even in the

# Factorization via Difference of Squares

- Suppose each of the numbers  $a_1, ..., a_r$  found in Step 1 has the property that  $c_i \equiv a_i^2 \pmod{N}$  factors into a product of small primes, for example, the first t primes  $\{p_1, p_2, ..., p_t\}$
- This means that there are exponents  $e_{ij}$  such that

$$c_1 = p_1^{e_{11}} p_2^{e_{12}} p_3^{e_{13}} \cdots p_t^{e_{1t}}, rac{10001}{1001} c_{1011} = p_1^{e_{11}} p_2^{e_{12}} p_3^{e_{23}} \cdots p_t^{e_{2t}}, rac{1110}{1110} c_{10111} c_{10111} c_{10111} c_{2} = p_1^{e_{21}} p_2^{e_{22}} p_3^{e_{23}} \cdots p_t^{e_{2t}}, rac{1110}{1100} c_{10111} c_{10111} c_{10111} c_{10111} c_{10111} c_{10111} c_{101111} c_{1011111} c_{10111111} c_{1011111} c_{1011111} c_{1011111} c_{1011111} c_{10111111} c_{10111111} c_{101111111} c_{10111111} c_{1011111} c_{1011111} c_{1011111} c_{1011111} c_{10111111} c_{$$

: :

$$c_r = p_1^{e_{r1}} p_2^{e_{r2}} p_3^{e_{r3}} \cdots p_t^{e_{rt}}.$$

# Factorization via Difference of Squares

• To recapitulate, we are given integers  $\{e_{ij}\}$ , and we are searching for integers  $u_1, u_2, \dots, u_r$  such that

$$e_{11}u_1 + e_{21}u_2 + \dots + e_{r1}u_r \equiv 0 \pmod{2},$$

$$e_{12}u_1 + e_{22}u_2 + \dots + e_{r2}u_r \equiv 0 \pmod{2},$$

$$e_{1t}u_1 + e_{2t}u_2 + \dots + e_{rt}u_r \equiv 0 \pmod{2}$$
.

- ullet This is a system of linear equations over the finite of the state of the finite of the finite of the finite of the state of the finite of the finite of the state of
- Hence standard techniques from linear algebra,
   such as Gaussian elimination, can be used to solve
   these equations
- Remark. In order to factor a large number N, it may be necessary to use a set  $\{p_1, p_2, ..., p_t\}$  containing hundreds of thousands, or even millions, of primes

# Factorization via Difference of Squares

- Then the system contains millions of linear equations, and being very difficult to solve
- However, it turns out that the systems of linear equations used in factorization are quite sparse
- There are special techniques for solving sparse systems of linear equations that are much more efficient than ordinary Gaussian elimination

# Smooth Numbers

- Definition An integer n is called B-smooth if all of its prime factors are less than or equal to B
- Example. The first few 5-smooth numbers and the first few numbers that are not 5-smooth:
  - 5-smooth: 2, 3, 4, 5, 6, 8, 9, 10, 12, 15,...
  - Not 5-smooth: 7,011,13, 14,17,19,...
  - **Definition**. The function  $\psi(X, B)$  counts B-smooth numbers,  $\psi(X, B) = \text{Number of } B$ -smooth integers n such that  $1 < n \le X$

Section 3.7

SMOOTH NUMBERS, SIEVES,

AND BUILDING RELATIONS

FOR FACTORIZATION

- - Since the 5-smooth numbers between 1 and 25
  - 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, 16, 18, 20, 24, 25
- In order to evaluate the efficiency of the three step factorization method, we need to understand how  $\psi(X,B)$  behaves for large values of X and B

#### Smooth Numbers

- Theorem (Canfield, Erdős, Pomerance).001110

00110001 01001011 0010 
$$(\ln X)^{\epsilon} < \ln B < (\ln X)^{1-\epsilon}$$

$$\overset{01001011}{\text{min}}\overset{10111001}{\text{min}}\overset{1010111}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}}\overset{11}{\text{min}$$

### **Smooth Numbers**

- The expression o(1) denotes a function that tends to 0 as X tends to infinity
- More generally, we write 001010 00111110 11010111 00010101 011101

if the ratio f(X)/g(X) tends to 0 as X tends to infinity

### **Smooth Numbers**

- The question remains of how we should choose B
- It turns out that the following curious-looking function L(X) is what we will need:

$$\psi(X, L(X)^c) = X \cdot L(X)^{-(1/2c)(1+o(1))}$$

$$as^1X \rightarrow \infty$$

$$\ln B = c \ln L(X) = c \sqrt{(\ln X)(\ln \ln X)}_{01}^{01}$$

satisfies  $(\ln X)^{\epsilon} < \ln B < (\ln X)^{1-\epsilon}$ 

• Apply: Theorem with OLID 00010100 00010001 01100011

$$\int_{0}^{1} u = \frac{\ln X}{\ln B} = \frac{1}{c} \cdot \sqrt{\frac{\ln X}{\ln \ln X}}$$

## **Smooth Numbers**

- The function  $L(X) = e^{\sqrt{(\ln X)(\ln \ln X)}}$  and other similar functions appear prominently in the theory of factorization due to their close relationship to the distribution of smooth numbers
- It is thus important to understand how fast L(X) grows as a function of  $X^{(1)}$
- As a supplement to big-O notation, it is convenient to introduce two other ways of comparing the rate at which functions grow

### **Smooth Numbers**

which completes the proof of the corollary

**3.32.** This exercise asks you to verify an assertion in the proof of Corollary 3.45. Let L(X) be the usual function  $L(X) = e^{\sqrt{(\ln X)(\ln \ln X)}}$ .

Ollilli (a) Prove that there is a value of  $\epsilon > 0$  such that

$$(\ln X)^{\epsilon} < \ln L(X) < (\ln X)^{1-\epsilon}$$
 for all  $X > 10$ .

(b) Let c > 0, let  $Y = L(X)^c$ , and let  $u = (\ln X)/(\ln Y)$ . Prove that

$$u^{-u} = L(X)^{-\frac{1}{2c}(1+o(1))}$$

### Smooth Numbers

- Definition (Order Notation). 11100010 10000101 10001110
- Let f(X) and g(X) be functions of X whose values are positive of X whose values are positive of X whose
  - We say that f is big- $\Omega$  of g and write

01010101 00100101 11110011 10
$$f(X) = \Omega(g(X))$$
00 01010111 01001000 1001 11101000 00010100 0100000 010 $f(X) = \Omega(g(X))$ 10 00101010 10101011 0001

if there are positive constants c and C such that

for all 
$$X \geq C$$

• If f is both big-O and big- $\Omega$  of g, we say that f is big- $\Theta$  of g, and write  $f(X) = \Theta(g(X))$ 

- Remark. In analytic number theory there is an include of the control of the con
- For functions f(X) and g(X), we write

$$f(X) \ll g(X)$$
 if  $f(X) = \mathcal{O}(g(X))$ ,

olitoologis
$$f(X)\gg g(X)$$
 if  $f(X)=\Omegaig(g(X)ig),$  in the second of  $f(X)$ 

odlidoli 
$$f(X) \gg \ll g(X)$$
 if  $f(X) = \Theta \big(g(X)\big)$  .

• The advantage of this notation is that it is that it is transitive: if  $f \gg g$  and  $g \gg h$ , then  $f \gg h$ 

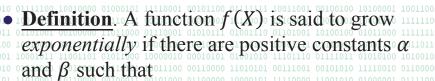

### **Smooth Numbers**

- In the alternative notation, exponential and polynomial growth are written, respectively, as  $X^{\alpha} \ll f(X) \ll X^{\beta}$  and  $(\ln X)^{\alpha} \ll f(X) \ll (\ln X)^{\beta}$ 
  - A function that falls in between these two categories is called *subexponential*
  - Thus f(X) is subexponential if for every positive constant  $\alpha$ , no matter how large, and for every positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small, which is the positive constant  $\beta$ , no matter how small  $\beta$ .

$$\Omega((\ln X)^{lpha}) = f(X) = \mathcal{O}(X^{eta})^{rac{111100}{0011}}$$

### **Smooth Numbers**

$$_{011011000}^{110110001}$$
  $_{10011100}^{100111000}$   $_{1110}^{1110}$   $\Omega(X^{lpha})=f(X)=\mathcal{O}(X^{eta})$   $_{.1}^{10001010}$   $_{0010101}^{111000}$   $_{0111010}^{111000}$ 

and it is said to grow *polynomially* if there are positive constants  $\alpha$  and  $\beta$  such that

$$\Omega((\ln X)^{lpha}) = f(X) = \mathcal{O}((\ln X)^{eta})$$

### **Smooth Numbers**

Remark. The function L(X) falls into the construction L(X) falls into the construction L(X) falls into the construction control of the co

X	$\ln L(X)$	L(X)
$2^{100}$	17.141	$2^{24.73}$
$2^{250}$	29.888	$2^{43.12}$
$2^{500}$	45.020	$2^{64.95}$
$2^{1000}$	67.335	$2^{97.14}$
$2^{2000}$	100.145	$2^{144.48}$

- 1100 0 00000 1000 0 0 1000 001 0 0 0 1100 000 0 0 0 0 1000 1110 0 0 1001
- Suppose that we attempt to factor N by searching for values  $a^2 \pmod{N}$  that are B-smooth
- Since the smooth numbers correspond to the variables, while the primes less than *B* correspond to the equations, we need (at least) as many *B*-smooth numbers as there are primes less than *B*
- We thus need at least  $\pi(B)$  B-smooth numbers, where  $\pi(B)$  is the number of primes up to B

- Proposition. Let  $L(X) = e^{\sqrt{(\ln X)(\ln \ln X)}}$ , let a large integer, and set  $B = L(N)^{\sqrt{2}}$ 
  - We expect to check approximately  $L(N)^{\sqrt{2}}$  random numbers modulo N in order to find  $\pi(B)$  numbers that are B-smooth
  - We expect to check approximately  $L(N)^{\sqrt{2}}$  random numbers of the form  $a^2 \pmod{N}$  in order to find enough B-smooth numbers to factor N
- Hence the factorization procedure should have a

### **Smooth Numbers**

- It will turn out that we can take  $B = L(N)^c$  for a suitable value of c
- In the next proposition we use the formula for  $\psi(X, L(X)^c)$  and the prime number theorem to choose the smallest value of c
- **Theorem** (The Prime Number Theorem).

$$\lim_{X \to \infty} \frac{\pi(X)}{X/\ln(X)} = 1$$

### **Smooth Numbers**

- *Proof.* We already explained why (a) and (b) are equivalent, assuming that the numbers  $a^2 \pmod{N}$  are sufficiently random. We now prove (a)
- The probability that a randomly chosen number modulo N is B-smooth is  $\psi(N,B)/N$
- In order to find  $\pi(B)$  numbers that are B-smooth, we need to check approximately

$$\frac{\pi(B)}{\psi(N,B)/N}$$

numbers

- 1000 0 00000 1000 0 0 0 10 1010 0 0 1100 1010 0 110101 10010 110101
- We want to choose B so as to minimize this function, since checking numbers for smoothness is a time-consuming process
- Corollary says that

$$\psi(N,L(N)^c)/Npprox L(N)^{-1/2c}$$

so we set  $B = L(N)^c$  and search for the value of c

### **Smooth Numbers**

The prime number theorem tells us that

$$\pi(B)$$

 $\overset{\circ}{\bullet}$  iSo that  $\overset{\circ}{\psi(N,L(N)^c)/N} pprox 1$ 

$$\frac{\frac{0001010}{0101110}}{\frac{1110100}{c}} \frac{L(N)^c}{\ln L(N)} \cdot \frac{1}{L(N)^{-1/2c}} = L(N)^{c+1/2c} \cdot \frac{1}{c \ln L(N)}$$

The factor  $L(N)^{\frac{c}{c-1}}$  dominates this last expression,

### **Smooth Numbers**

- It is minimized when  $c_1 = \frac{1}{\sqrt{2}}$ , and the minimum
- Thus if we choose  $B \approx L(N)^{\frac{1}{\sqrt{2}}}$ , then we need to check approximately  $L(N)^{\sqrt{2}}$  values in order to find  $\pi(B)$  numbers that are B-smooth, and hence to find enough relations to factor N

### **Smooth Numbers**

- Remark. Proposition suggests that we need to check approximately  $L(N)^{\sqrt{2}}$  randomly chosen numbers modulo N in order to find enough smooth numbers to factor N
- In particular, it suffices to check approximately L(N) random numbers of the form  $a^2 \pmod{N}$  with a close to  $\sqrt{N}$

- 1100 0 00000 1000 0 0 1000 001 0 0 0 1000 1000 0 1000 1100 0 1000 1100 0 1000
- Remark. When estimating the effort needed to factor N, we have completely ignored the work required to check whether a given number is B-smooth
- Taking this additional effort into account, one finds that it takes approximately  $L(N)^{\sqrt{2}}$  trial divisions to find enough smooth numbers to factor N, even using values of  $a \approx \sqrt{N}$

#### Smooth Numbers

- The quadratic sieve uses a more efficient method for generating B-smooth numbers and thereby reduces the running time down to L(N)
- The number field sieve, moving beyond the realm of the ordinary integers, achieves running time of  $e^{c\sqrt[3]{(\ln N)(\ln \ln N)^2}}$  faster than  $L(N)^{\epsilon} \forall \epsilon > 0$

# The Quadratic Sieve

• We know that we need to take  $B \approx L(N)^{\frac{1}{\sqrt{2}}}$  in order to have a reasonable chance of factoring N

How can we efficiently find many numbers  $a > \sqrt{N}$  such that each  $a^2 \pmod{N}$  is B-smooth?

• An early approach to finding *B*-smooth squares modulo *N* was to look for fractions  $\frac{a}{b}$  that are as close as possible to  $\sqrt{kN}$  for k = 1, 2, 3, ...

# The Quadratic Sieve

- Then  $a^2 \approx b^2 kN$ , so c is reasonably small, and thus is more likely to be B-smooth
- The theory of continued fractions gives an algorithm for finding such  $\frac{a}{b}$
- An alternative approach that turns out to be much faster in practice is to allow slightly larger values of a and to use an efficient cancellation process called a *sieve* to simultaneously create a large number of values  $a^2 \pmod{N}$  that are B-smooth

- The Pomerance's *quadratic sieve* is still the fastest known method for factoring large numbers N = pq up to about  $2^{350}$
- For numbers considerably larger than this, say larger than 2<sup>450</sup>, the more complicated *number* field sieve holds the world record for quickest

# The Quadratic Sieve

- What we need is a list of numbers of the form  $a^2 \pmod{N}$  that are B-smooth
- Our strategy for accomplishing this uses the polynomial

$$F(T) = T^2 - N$$

- We want to start with a value of a that is slightly larger than  $\sqrt{N}$ , so we set  $a = |\sqrt{N}| + 1$
- We then look at the list of numbers

$$F(a), F(a+1), F(a+2), \dots, F(b)$$

# The Quadratic Sieve

- The idea is to find the B-smooth numbers in this of the list by sieving away the primes smaller than B and seeing which numbers in the list get sieved all the way down to 10 of the list way down to 10 of the list way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of the way down to 10 of the list get sieved all of t
- We choose B sufficiently large so that, by the end of the sieving process, we are likely to have found enough B-smooth numbers to factor N

# The Quadratic Sieve

- **Definition**. The set of primes less than *B* (or sometimes the set of prime powers less than *B*) is called the *factor base*
- Suppose that p is a prime in our factor base
- Which numbers t between a and b satisfy

$$t^2 \equiv N \pmod{p}$$

- Otherwise the congruence has two solutions, which we denote by

# The Quadratic Sieve

It follows that each of the numbers

$$F(\alpha_p), F(\alpha_p + p), F(\alpha_p + 2p), F(\alpha_p + 3p), \dots$$
  
 $F(\beta_p), F(\beta_p + p), F(\beta_p + 2p), F(\beta_p + 3p), \dots$ 

is divisible by p

$$F(a), F(a+1), F(a+2), \ldots, F(b)$$

# The Quadratic Sieve

- Example. We illustrate the quadratic sieve applied to the composite number N = 221
- The smallest number whose square is larger than  $^{0011000}$   $^{0111000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{1011000}$   $^{10110000}$   $^{10111000}$   $^{10110000}$   $^{10111000}$   $^{10110000}$   $^{10111000}$   $^{10110000}$   $^{10110000}$   $^{10110000}$   $^{10110000}$   $^{101100000}$   $^{101100000}$   $^{101100000}$   $^{101100000}$   $^{101100000}$   $^{101100000}$
- We set  $F(T) = T^2 221$  and sieve the numbers from F(15) = 4 up to F(30) = 679 using successively the prime powers from 2 to 7

# The Quadratic Sieve

- We first sieve by p=2, which means that we is cancel 2 from every second entry in the list of the second control of the second co

 $\stackrel{\text{def}}{\bullet} \stackrel{\text{def}}{\bullet} \underset{\text{interpretation}}{\text{Nextwe sieve by $p$}} \stackrel{\text{def}}{=} \stackrel{\text{def}}$ 

has no solution. None of the entries are divisible

- $^{\circ}$  1. We move on to the prime power 2  $^{\circ}$
- Every odd number is a solution of the congruence

which means that we can sieve another factor of 2 from every second entry in our list

2	35	34	103	70	179	110	263	154	355	202	455	254	563	310	679
1	35	17	103	35	179	55	263	77	355	101	455	127	563	155	679

• The small 4 is to indicate sieving by 4, although cancel only a factor of 2 from each entry

## The Quadratic Sieve

- Next we move on to p=5. The congruence  $t^2=221\equiv 1\pmod{5}$

has two solutions, 
$$\alpha_5 = 1$$
 and  $\beta_5 = 4$  modulo 5

• The first t value in our list that is congruent to 1 modulo 5 is t = 16, so starting with F(16), we find that every fifth entry is divisible by 5

# The Quadratic Sieve

• Similarly, every fifth entry starting with F(19) is divisible by 5, so we sieve out those factors

- More generally, congruences  $t^2 \equiv N \pmod{p^e}$  have either 0 or 2 solutions
- This makes sieving odd prime powers relatively straightforward

# The Quadratic Sieve

- Remark. There are many implementation ideas that can be used to greatly increase the practical speed of the quadratic sieve
- Although the running time of the sieve remains a constant multiple of L(N), the multiple can be significantly reduced
- A time-consuming part of the sieve is the necessity
  of dividing every p-th entry by p, since if the
  inumbers are large, division by p is moderately
  complicated
  complicated

# The Quadratic Sieve

- Sieving with powers of 2 is a bit trickier, since the number of solutions may be different modulo 2, modulo 4, and modulo higher powers of 2
- So although sieving powers of 2 is not intrinsically difficult, it must be dealt with as a special case

# The Quadratic Sieve

- approximate logarithms, which allows the slower division operations to be replaced by faster
- Instead of using the list of values of the list of the list of values of the list of

$$\log F(a)$$
,  $\log F(a+1)$ ,  $\log F(a+2)$ ,  $\log F(a+3)$ , ...

In order to sieve p from F(t), we subtract an integer approximation of  $\log p$  from the integer approximation to  $\log F(t)$ , since by the rule of logarithms

$$\frac{1}{1000} \log F(t) - \log p = \log rac{F(t)}{p} rac{101}{1010} rac{101}{1010} rac{101}{1010}$$

• At the end of the sieving process, the entries that are reduced to 0 would be precisely the values of F(t) that are B-smooth

### The Number Field Sieve

- The number field sieve is a factorization method that works in a ring that is larger than the ordinary
- In order to factor N, we start by finding a nonzero integer m and an irreducible monic polynomial  $f(x) \in \mathbb{Z}[x]$  of small degree satisfying  $f(m) \equiv 0 \pmod{N}$

# The Quadratic Sieve

- However, since we use only approximate logarithm values, at the end we look for entries that have been reduced to a small number.
- Then we use division on only those few entries to find the ones that are actually *B*-smooth
- A second idea that can be used to speed the quadratic sieve is to use the polynomial only until t reaches a certain size, and then replace it with a new polynomial in the polynomial of th

### The Number Field Sieve

- Example. Suppose that we want to factor the number  $N_1 = 2^{2^{9/11}} + 1^{1/1001}$
- Then we could take  $m = 2^{103}$  and  $f(x) = x^{5} + 8$ , or a since with a continuous continuous

$$\int_{0}^{1} f(m) = f(2^{103}) = 2^{515} + 8^{\frac{10101}{10101000}}_{\frac{01010}{10101001}} = 8(2^{512} + 1) \equiv 0 \pmod{2^{2^9} + 1}$$

- Let d be the degree of f(x) and  $\beta$  be a root of f(x)
- Note that  $\beta$  might be a complex number
- We will work in the ring 10010101 11110000

• Although we have written  $\mathbb{Z}[\beta]$  as a subring of the complex numbers, we can work with  $\mathbb{Z}[\beta]$  purely algebraically, since it is equal to the quotient ring

### The Number Field Sieve

- Example. Let  $f(x) = 1 + 3x 2x^3 + x^4$ , let  $\beta$  be a root of f(x), and consider the ring  $\mathbb{Z}[\beta]$
- In order to add the elements

$$\begin{array}{c} \begin{array}{c} \begin{array}{c} 1.011 & 0.0111000 & 11101111 & 12001110 & 1110100 & 112102 & 1211000 & 130111 \\ 1.110 & 0.0001110 & 1211 & 1211000 & 1211111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 1211111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 121111 & 1211111 & 1211111 & 1211111 & 1211111 & 121111 & 121111 & 1211111 & 1211111 & 1211111 & 1211111 & 1211111 & 1211111 & 1$$

$$u+v=3-2eta+3eta^2+eta^3$$

### The Number Field Sieve

- Multiplication is a bit more complicated
- First we multiply u and v, treating  $\beta$  as if it were a variable  $\frac{100111000}{100110000}$   $\frac{11010000}{10010000}$   $\frac{11010000}{1000000}$   $\frac{11010000}{11000000}$   $\frac{11010000}{11000000}$   $\frac{11010000}{11000000}$

$$uv = 2 - 9\beta^2 + 29\beta^3 - 14\beta^4 - 26\beta^5 - 6\beta^6$$

Then we divide by  $f(\beta) = 1 + 3\beta - 2\beta^3 + \beta^4$ , still treating  $\beta$  as a variable, and keep the remainder remainder

$$uv = 92 + 308\beta + 111\beta^2 - 133\beta^3 \in \mathbb{Z}[\beta]$$

### The Number Field Sieve

The next step in the number field sieve is to find a large number of pairs of integers in the number of pairs of integers.

$$(a_1,b_1),\dots,(a_k,b_k)$$

that simultaneously satisfy

$$\prod_{i=1}^{k} (a_i - b_i m) \text{ is a square in } \mathbb{Z}_{\frac{1000}{1100}}^{\frac{1000}{1000}}$$

and

$$\prod_{i=1}^{n} (a_i - b_i \beta) \text{ is a square in } \mathbb{Z}[\beta]_{0101}^{0100}$$

011111 • 0:Asiusual, there is then a good chance that 1111 1011110 0011010  $\gcd(A - B, N)$  will yield a nontrivial factor of N

- 100 00000 000 00000 010 00000 100 00000 100 00000
- How do we find the  $(a_i, b_i)$  pairs to make both of the products into squares?
- For the first product, we can use a sieve-type algorithm to find values of a bm that are smooth, then use linear algebra to find a subset with the desired property
- Pollard's idea is to simultaneously do something similar for the second product while working in the ring  $\mathbb{Z}[\beta]$

#### The Number Field Sieve

- Thus we look for pairs of integers (a, b) such that the quantity  $a b\beta$  is "smooth" in  $\mathbb{Z}[\beta]$
- There are many serious issues that arise when we try to do this, including the following:

The ring  $\mathbb{Z}[\beta]$  usually does not have unique factorization of elements into primes or irreducible elements. So instead, we factor the ideal  $(a-b\beta)$  into a product of prime ideals. We say that  $a-b\beta$  is smooth if the prime ideals appearing in the factorization are small.

#### The Number Field Sieve

- Unfortunately, even ideals in the ring  $\mathbb{Z}[\beta]$  may not have unique factorization as a product of prime ideals. However, there is a slightly larger ring, called the ring of integers of  $\mathbb{Q}(\beta)$ , in which unique factorization of ideals is true
- Suppose that we have managed to make the ideal  $(\prod (a_i b_i \beta))$  into the square of an ideal in  $\mathbb{Z}[\beta]$ , it need not be the square of an ideal generated by a single element. Even if it is equal to an ideal of the form  $(\gamma)^2$ , we can conclude only that  $\prod (a_i b_i \beta) = u\gamma^2$  for some unit  $u \in \mathbb{Z}[\beta]^*$

### The Number Field Sieve

- It would take us too far afield to explain how to deal with these potential difficulties
- Through a number of ingenious ideas due to Adleman, Buhler, H. Lenstra, Pomerance, and others, the obstacles were overcome, leading to a practical factorization method

- However, we will comment further on the first step in the algorithm. In order to get started, we need an integer m and a monic irreducible polynomial f(x) of small degree such that
- The trick is first to choose the desired degree d of f, next to choose an integer m satisfying

$$N^{1/1001}$$
 1011  $(N/2)^{1/d} < m < N^{1/d}$  1010  $N^{1/d}$  1010

### The Number Field Sieve

• Then to write N as a number to the base m

$$N = c_0 + c_1 m + c_2 m^2 + \dots + c_{d-1} m^{d-1} + c_d m^d$$

 $\min_{i=1}^{n} (h^{i}) \leq c_{i}^{n} \leq m^{110}$ 

• or take f to be the monic polynomial of the polynomial of the

$$\int_{0}^{1} f(x) = c_0 + c_1 x + c_2 x^2 + \dots + c_{d-1} x^{d-1} + x^{d_0}$$

### The Number Field Sieve

- We also need f(x) to be irreducible, but if f(x) factors in  $\mathbb{Z}[\beta]$ , say f(x) = g(x)h(x), then N = f(m) = g(m)h(m)
  - gives a factorization of N
- So now we have an f(x) and an m, which allows us to get started using the number field sieve

### The Number Field Sieve

- \*\* There is no denying the fact that the number field silved is much more complicated than the silved is sieve. So why is it useful?
  - The reason has to do with the size of the numbers that must be considered
  - For the quadratic sieve, we sieved to find smooth numbers of the form

$$(\lfloor \sqrt{N} \rfloor + k)^2 - N_0$$

- So we needed to pick out the smooth numbers from a set of numbers whose size is a little larger than  $\sqrt{N}$

$$^{ ext{00110100}}_{ ext{10010011}}(a-mb)\cdot b^d f(a/b)^{ ext{110010011}}_{ ext{11001110}}$$

• By a judicious choice of m and f, these numbers are much smaller than  $\sqrt{N}$ 

#### The Number Field Sieve

- In order to describe how much smaller, we use a generalization of the subexponential function
- $\begin{array}{l} \overset{\circ}{\text{lo}} \overset{\circ}{\text{lo}} \overset{\circ}{\text{lo}} \overset{\circ}{\text{loothom}} \overset{\circ}{\text{loothom$

Theorem. Under some reasonable assumptions the expected running time of the number field sieve to factor the number N is  $L_{1/3}(N)^c$  for a small walks of c

### The Number Field Sieve

- For general numbers, the best known value of c in Theorem is a bit less than 2, while for special numbers such as  $2^{2^9} + 1$  it is closer to 1.5
- As a practical matter, the quadratic sieve is faster for numbers smaller than  $10^{100}$ , while the number field sieve is faster for numbers larger than  $10^{130}$

Section 3.8

- The index calculus is a method for solving the discrete logarithm problem in a finite field  $\mathbb{F}_p$
- The algorithm uses smooth numbers and bears some similarity to the sieve methods that we have studied in this chapter, which is why we cover it here

#### The Index Calculus Method

- For simplicity, we will assume that g is a primitive root modulo p, so its powers give all of  $\mathbb{F}_p^*$
- We choose a value  $B_0$  and solve the discrete  $\frac{10000110}{10111100}$   $\frac{1010111}{1001100}$   $\frac{1010111}{1001100}$   $\frac{1010110}{1001100}$   $\frac{1010110}{1001100}$   $\frac{1010110}{1001100}$   $\frac{1010110}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10101100}{1001100}$   $\frac{10001100}{1001100}$

### The Index Calculus Method

• Having done this, we next look at the quantities

$$h \cdot g^{-k} \pmod{p}$$
 for  $k = 1, 2, \dots$ 

until we find a value of k such that  $h \cdot g^{-k} \pmod{p}$  is B-smooth.

• For this value of k we have 11001110 101

$$h \cdot g^{-k} \equiv \prod_{\ell \le B} \ell^{e_{\ell}} \pmod{p} \stackrel{\text{1110}}{\underset{\text{1000}}{\text{1011}}}$$

for certain exponents  $e_l$ 

#### The Index Calculus Method

• We rewrite in terms of discrete logarithms as

$$\log_g(h) \equiv k + \sum_{\ell \le B} e_{\ell} \cdot \log_g(\ell) \pmod{p-1}$$

- But we are assuming that we already computed  $\log_g(l)$  for all primes  $l \leq B$
- Hence the formula gives the value of  $\log_g(h)$
- $\begin{array}{c} {}^{10011011} \; {}^{100000111} \; {}^{10010011} \; {}^{00010011} \; {}^{00010110} \; {}^{101011011} \; {}^{11010110} \; {}^{10111010} \; {}^{00110101} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101001} \; {}^{01101101} \; {}^{01101001} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{011011011} \; {}^{01101101} \; {}^{0110101} \; {}^{01101101} \; {}^{01101101} \; {}^{01101101} \; {}^{$

- 100 0 0 0000 100 0 0 0 100 100 0 0 100 100 0 0 1001 100 0 110 1011
- For a random selection of exponents i we compute  $g_i \equiv g^i \pmod{p}$  with  $0 < g_i < p$
- If  $g_i$  is not B-smooth, then we discard it, while if  $g_i$  is B-smooth, then we can factor it as

$$g_i = \prod_{\ell \le B} \ell^{u_\ell(i)}$$

### The Index Calculus Method

- Standard linear algebra methods such as Gaussian elimination do not work well modulo composite numbers, because there are numbers that do not have multiplicative inverses and the such as Gaussian that it is the such as Gaussian and the such as Ga
- The Chinese remainder theorem solves this

#### The Index Calculus Method

• Interms of discrete logarithms, this gives the 10 class of t

$$i \equiv \log_g(g_i) \equiv \sum_{\ell \le B} u_\ell(i) \cdot \log_g(\ell) \pmod{p-1}$$

- Notice that the only unknown quantities in the formula are the discrete logarithm values  $\log_g(l)$
- So if we can find more than  $\pi(B)$  equations, then we can use linear algebra to solve for the  $\log_g(l)$  "variables"

#### The Index Calculus Method

- First we solve the congruences modulo q for each prime q dividing p = 1
- Then, if q appears in the factorization of p-1 to a power  $q^e$ , we lift the solution from  $\mathbb{Z}/q\mathbb{Z}$  to  $\mathbb{Z}/q^e\mathbb{Z}$
- Finally, we use the Chinese remainder theorem to combine solutions modulo prime powers to obtain a solution modulo p-1

- In cryptographic applications one should choose p such that p-1 is divisible by a large prime; otherwise, the Pohlig-Hellman algorithm solves the discrete logarithm problem
- For example, if we select p = 2q + 1 with q prime, then the index calculus requires us to solve simultaneous congruences modulo q and modulo q

#### The Index Calculus Method

• Example. We let p be the prime p=18443 and use the index calculus to solve the discrete colonic colonic

$$37^x \equiv 221 \pmod{18443}$$

- We note that g = 37 is a primitive root modulo p = 18443
- $1.010 \cdot 1.100 \cdot 1.1000 \cdot 1.0000001 \cdot 1.0000001 \cdot 1.0000110 \cdot 1.0$

### The Index Calculus Method

- We start by taking random powers of g = 37 modulo 18443 and pick out the ones that are B = 38 smooth
- A couple of hundred attempts gives four

$$g^{101110}g^{12708} \equiv 2^3 \cdot 3^4 \cdot 5 \pmod{18443}, \frac{1010}{10010101}$$
  $g^{15400} \equiv 2^3 \cdot 3^3 \cdot 5 \pmod{18443}, \frac{1010}{100101}$   $g^{15400} \equiv 2^3 \cdot 3^3 \cdot 5 \pmod{18443}, \frac{1010}{0001}$   $g^{11311} \equiv 2^3 \cdot 5^2 \pmod{18443}, \frac{1010}{10001001}$   $g^{2731} \equiv 2^3 \cdot 3 \cdot 5^4 \pmod{18443}, \frac{1010}{10010101}$   $g^{2731} \equiv 2^3 \cdot 3 \cdot 5^4 \pmod{18443}. \frac{1010}{10101101}$ 

### The Index Calculus Method

• These in turn give linear relations for the discrete of logarithms of 2003 and 5 to the base g. For 1011010 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 10010101 100

$$12708 = 3 \cdot \log_g(2) + 4 \cdot \log_g(3) + \log_g(5)$$

 $^{1}$   $\stackrel{\circ}{\sim}$   $^{\circ}$   $^{\circ}$ 

$$x_2 = \log_g(2), \quad x_3 = \log_g(3), \quad \text{and} \quad x_5 = \log_g(5)$$

• 10 Then the four congruences become the following 00010110 

$$212708 = 3x_2 + 4x_3 + x_5 \pmod{18442},$$

$$\lim_{x \to 1} 11311 = 3x_2 + 2x_5 \pmod{18442},$$

Note that the formulas are congruences modulo

$$\begin{smallmatrix} 10011011 & 10000111 & 10010011 & 0221110 & 1101111 & 1181412110 & 21101922110 & 00100100 \\ 01111010 & 00110010 & 01010011 & 12000111 & 118141200110 & 21101922111 & 10001111 \end{smallmatrix}$$

### The Index Calculus Method

- The number 9221 is prime, so we need to solve the system of linear equations modulo 2 and
- on This is easily accomplished by Gaussian on on one of the second of th oolingol aloololi oolootil allilooo jallil oolollil tiollolo olololol ollooooo ololliloo ollooooo elimination: The solutions are oololoo olololli oloolooo 10011000 ollooloo

$$(x_2, x_3, x_5) \equiv (1, 0, 1) \pmod{2},$$

$$\binom{011\ 1000}{010\ 0011}(x_2, x_3, x_5) \equiv (5733, 6529, 6277) \pmod{9221}$$

#### The Index Calculus Method

• Combining these solutions yields 10000101 10001110 111111100

$$(x_2, x_3, x_5) \equiv (5733, 15750, 6277) \pmod{18442}^{00}$$

We check the solutions by computing 

$$^{1101001}_{100010101001} \, ^{100}_{000} \, 37^{15750} \equiv 3 \, (\mathrm{mod} \, 18443), ^{100110}_{1011001010010} \, ^{1001011}_{1010001101001000000}$$

$$37^{6277} \equiv 5 \pmod{18443}^{111011}_{1000}$$

### The Index Calculus Method

- ullet 1. We compute the value of 000001 11110000 1100100 0100001 011110010 0100001 000110000

$$^{000}$$
 11011011 00111000 1112111 100013  $7^{011}k^{00}$  1101110 118443 111 0001010 0001100 00001110 100 10011010 10001110 100011110 100011110 100011110 11000001

for random values of k until we find a value that  $10110100 \ 1is^{1}B$ -smooth  $1000001 \ 01000001 \ 11101000 \ 11001110 \ 10100001 \ 01010100 \ 10000110 \ 10101111$ 

After a few attempts we find that: 01101100 00100100 11

$$211 \cdot 37^{-9549} \equiv 2^5 \cdot 3^2 \cdot 5^2 \pmod{18443}$$

$$\frac{11}{11}\log_g(211) = 9549 + 5\log_g(2) + 2\log_g(3) + 2\log_g(5) 
= 9549 + 5 \cdot 5733 + 2 \cdot 15750 + 2 \cdot 6277 \equiv 8500 \pmod{18442}$$

• Finally, we check our answer  $\log_g(211) = 8500$ 

$$37^{8500} \equiv 211 \pmod{18443}$$

- office stands in marked contrast to the discrete 11110100 logarithm problem in elliptic curve groups 10 10110110 0101
- Currently, the best known algorithms to solve the igeneral discrete logarithm problem in elliptic curve groups are fully exponential 01010111 01001000 10011000 01100010

- Remark. The index calculus is a subexponential algorithm for solving the discrete logarithm
- Using ideas based on the number field sieve, the running time can be further reduced to a small
